A doctor provides pain management tips for doctors

I have represented a number of physicians who have been accused of "using opioids." Some of these cases have involved allegations of overprescribing, inappropriate medication use, or inappropriate scheduling of patients. These cases are becoming more common and are raising important questions about how to best manage pain in patients.

In many cases, pain is a multifaceted issue that requires a comprehensive approach. Pain management is not just about prescribing medications, but also involves addressing underlying psychological and social factors. In this article, I discuss some of the challenges and considerations that doctors may face when managing pain in their patients.

I have represented a number of physicians who have been accused of "using opioids."
